PHASE I BOOK EXPLOITATION 762

- Pavlov, Fedor Fedorovich, Doctor of Technical Sciences, Professor;
Mashkevich, Vladimir Pavlovich, Candidate of Technical Sciences,
Docent; Fedorov, Boris Dmitriyevich, Candidate of Technical
Sciences, Docent

Geodeziya (Geodesy) Mosoow, Ugletekhizdat, 1955. 356 p. 10,000
copies printed.

Responsible Ed.: Gusev, N.A.; Ed. of Publishing House: Slovorosov,
A.Kh.; Tech. Ed.: Prozorovskaya, V.L.

PURPOSE: This is a textbook designed for mining and mining engine-
ering students at the university level and for independent
study by mine workers.

COVERAGE: This manual is published for mining and metallurgical
vuzes under the auspices of the USSR Ministry of Higher Educa-
tion and was written by members of the Moscow Mining Institute
under the direction of Professor F.F. Pavlov. Chapters I, II,

Card 1/ 12

Geodesy

762

IV, VI, VII, VIII, IX, and X were written by Professor F.F. Pavlov and docents V.P. Mashkevich and B.D. Fedorov; chapters III, V, XIV, XV and Sec. 19 by B.D. Fedorov, and chapters XI, XII and XIII by Professor Pavlov. The book presents the theory and practice of geodesy as applied to modern mining and mining engineering operations. The text is accompanied by numerous diagrams, maps, photographs and tables. Instruments and methods of making measurements are described in considerable detail. By way of introduction, Chapter I provides a brief account of the historical development of geodesy and particularly its development in Russia. It concludes by stating that in 1940 the Central Scientific Research Institute of Geology and Cartography under Professor F.N. Krasovskiy, redetermined the dimensions of the Earth's ellipsoid and that all geodestic and cartographic work in the USSR as of April 7, 1946 has been based on the new dimensions. The new ellipsoid is known as the Krasovsky ellipsoid. By 1950 class I triangulations had reached a total of 75,000 km. and class I and II leveling, 150,000 km. A considerable part

Card 2/12

Geodesy

762

of the Soviet Union is now covered by a complete network of triangulations. Mentioned in the introduction as having made outstanding contributions in the fields of geodesy and cartography are Professor N.G. Kell', Professor A.S. Chebotarev, A.A. Mikhaylov, N.A. Urmayev, V.V. Danilov, and V.V. Popov, corresponding members of the USSR Academy of Sciences; F.N. Krasovskiy, A.A. Izotov, A.A. Mikhaylov and M.S. Molodenskiy who had worked out new methods of determining the shape of the Earth; and Professor Doctor F.V. Drobyshev, Professor N.M. Aleksapol'skiy, M.D. Konshin, M.M. Rusinov, V.A. Belitsyn, G.Yu. Stodolkevich, and Docent N.A. Gusev, eminent designers of geodetic instruments who have been awarded Stalin prizes for their work.

PHASE I BOOK EXPLOITATION
Fedorov, Boris Dmitriyevich

Fedorov, Boris Dmitriyevich

383

Geodeziya (Geodesy) Moscow, Ugletekhizdat, 1957. 379 p. 12,000 copies printed.

RESP. ED.: Serebryanniy, A. G.; Ed. of Publishing House: Slavorosov, A. Kh.;
Tech. Ed.: Nadeinskaya, A. A.

PURPOSE : This is a textbook for the course "Geodesy" taken by students specializing in surveying at mining institutes.

COVERAGE: The author puts special emphasis on linking geodesy with other subjects in mining engineering, such as underground geometry, etc. The book supplies fundamental information on the topography of the earth's surface and on map making. Field and office work in geodetic surveying is described in considerable detail. Among other things, the book describes a number of tools and instruments used by surveyors. The majority of these descriptions are accompanied by photographs and/or diagrams. Mentioned are: measuring tapes, clinometers, cross staff, optical squares, azimuth and prismatic compass, transits and their optical parts (among them the following transits: TG-1, TT-2, TT-50 and OT-10), an office computer, planimeter, dumpy levels (among them the types NV-1 and NG); Y-levels (types NP-1 and NT), "Geofizika" precision level, Stodolkevich level (type NS), automatic level mounted on a bicycle (designed by M. P. Leontovskiy and K. P. Nechiporenko), Artanov automatic level, the Raabek automatic level;
Card 1/14

Geodesy

383

levelling rods; cross-hair and other range-finders, two automatic tachometers (the Stodolkovich type and type NF; plane tables and alidades, phototheodolite, aerial photographic camera, projection lamp, and aneroid barometer. The following Soviet instrument designers are mentioned: Professor F. V. Drobyshch, Professor M. D. Konshin, Professor M. M. Rusinov, Professor I. M. Aleksapol'skiy, Professor V. A. Belitsyn, Professor M. P. Leontovskiy, Professor K. P. Nechiporenko, Professor A. P. Bolotov, Docent G. Yu. Stodolkovich and Doctor N. A. Gusev, Engineer M. A. Artanov and Engineer Ye. V. Raabek. The following Soviet scientists are mentioned in the field of earth science: Professor F. N. Krasovskiy, Professor A. A. Izotov, Professor A. A. Mikhaylov, and Professor M. S. Molodenskiy. The following Soviet scientists are mentioned in the field of geodesy and cartography: Professor N. G. Kell', Professor A. S. Chebotarev, Professor N. A. Urmayev, Professor V. V. Danilov, and Professor V. V. Popov. There are 281 figures, 32 Soviet references, and 30 tables. Some of the tables give specifications of instruments.

SOV/2971

Fedorov, Boris Fedorovich

Mekhanizatsiya slesarno-sborochnykh i montazhnykh rabot (Mechanization of Bench and Assembly Work) Moscow, Mashgiz, 1957. 306 p. Errata slip inserted. 18,000 copies printed.

Tech. Ed.: G.A. Sarafannikova; Reviewer: M.P. Novikov, Candidate of Technical Sciences; Ed.: M.A. Bezukladnikov, Engineer; Ed. (Ural-Siberian Division, Mashgiz): M.I. Sustavov, Engineer.

PURPOSE: This book is intended for mechanics and machinists studying to improve their skill.

COVERAGE: The book deals with the fundamentals of mechanization in machine-assembly work. The information given is based on practices of Soviet and non-Soviet plants, work done at scientific research institutes, and progress made by industrial innovators. Basic operations involved in bench and assembly work are treated from the point of view of proposed mechanization. Examples of the use

Card 1/6

Mechanization of Bench and Assembly Work

S/708/59/000/002/008/008
D221/D303

AUTHOR: Fedorov, B.F., Candidate of Technical Sciences
TITLE: The new technological process of expanding and pressing-in of connections
SOURCE: Izhevsk. Mekhanicheskiy institut. Voprosy tochnosti metallorezhushchikh stankov i mekhanicheskoy obrabotki, no. 2, 1959, 100 - 112

TEXT: The process of stripping parts fitted under pressure was investigated. It concerned the formation of an oil film between the mated surfaces. The oil pressed by hand pumps provides a fluid friction between the conjugated surfaces and, therefore, reduces the effort required for stripping. This pressure of oil is determined by $p = p_1 + p_2 + p_3$, where p_1 is the oil pressure necessary to counter the pressure in the contact zone; p_2 the oil pressure required for the sleeve expansion, p_3 is the pressure corresponding to the additional expansion of sleeve and compression of shaft for en-
Card 1/3

The new technological process ...

S/708/59/000/002/008/008
D221/D303

During a formation of an oil film between them. Equations are quoted for each component which take into account the deformations, surface roughness, moduli of the materials, dimensions and other factors. The use of high pressure caused some doubts as to the possibility of exceeding the limits of elastic deformations, but the calculations and experiments demonstrated that there is no such risk. A detailed description is given of the hand pump. The tests demonstrated the feasibility of stripping by using any mineral oil. The disposition of the oil groove affects the effort of stripping. The duration of the press fit does not affect the oil pressure. The diagrams of stripping with and without oil pressure indicate a marked difference. The possibility of press fit with the use of oil pressure was established. Nomograms were plotted on the basis of the equation of oil pressure which is required for calculating the quantities in question. These curves are applicable for connections of components made in normalized steel, and moduli of elasticity of the sleeve up to 2100000 kg/cm^2 , or 2000000 kg/cm^2 for the shaft. A numerical example of application of this chart is given. This new method reduces the service cycle for equipment. Repeated pressing

Mekhanizatsiya i avtomatizatsiya sborochnykh rabot (Mechanization and Automation of Assembling) Moscow, Mashgiz, 1959. 105 p. (Series: Biblioteka slesarya-sborshchika, vyp. 8) 12,000 copies printed.

Ed. of Publishing House: M.I. Sustavov; Tech. Ed.: N.A. Dugina; Editorial Board of Series: S.M. Konyukhov, Engineer; M.P. Novikov, Candidate of Technical Sciences; V.T. Poluyanov, Engineer; A.N. Ryabov, Engineer; M.I. Sustavov, Engineer (Ed. of Book); and B.F. Fedorov, Candidate of Technical Sciences.

PURPOSE: The book is intended for assemblers.

COVERAGE: The author of this book, the 8th issue of the "Benchmark Assembler's Library," discusses the basic trends in mechanization and automation of assembly operations. He describes briefly modern means of full mechanization and mentions the economic advantages of introducing partial and total mechanization and automation into the assembly process. Many examples of achievements in the field

TITLE: Use of Permeable Porous Ceramics for the Experimental Study
of Mass Exchange Effects

PERIODICAL: Inzhenerno-fizicheskii zhurnal, 1961, Vol. 4, No. 2,
pp. 99-102

TEXT: A description is first given of the preparation of porous ceramics made of 75% chamotte, 12.5% kaolin, 12.5% clay, and 0.5% water glass, intended to serve for a study of mass exchange phenomena. The components were pulverized, treated with water (30 per cent by weight), transferred to suitable molds, dried, and burned. The pore size was determined by a method devised by Ritter and Drace (Ref. 5), in which mercury is pressed through the ceramics. A formula is given for the diameter distribution of radii, and formulas by B. V. Deryagin are also given for the calculation of the specific surface of the ceramics and the permeability to air. Experimental results obtained show that permeability, specific surface,

and maximum pore radius can be reduced by better grinding of the components, and by burning at lower temperatures (which, however, entails an impairment of mechanical properties). There are 3 figures and 6 references: 5 Soviet and 1 US. ✓

TITLE: Experimental study of water transpiration cooling in a non-isothermic turbulent boundary layer

SOURCE: Inzhenerno-fizicheskiy zhurnal, no. 1, 1964, 21-27

TOPIC TAGS: transpiration cooling, porous plate, heat transfer, mass transfer, turbulent boundary layer

ABSTRACT: Results are given of an experimental investigation of transpiration cooling by water of a porous ceramic plate under conditions of a turbulent boundary layer in a gradient air flow. The test equipment is shown in a sketch and is described in detail. The ambient temperature ranged from 50 to 130 C and the local Reynolds numbers from $(1.5 \text{ to } 3.5) \times 10^5$. Heat and mass transfer coefficients were determined by the heat substance balance both at the wall and in the boundary layer. Dimensionless formulas are derived for the combined rate of heat and mass transfer. The effect of the longitudinal pressure gradient and moderate turbulence on transpiration cooling is estimated. Orig. art. has 4 figs.

TITLE: Measurements of turbulent non-isothermal flow

SOURCE: Leningrad. Politekhnicheskiiy Institut. Trudy*, no. 230, 1964.
Tekhnicheskaya gidromekhanika (Technical hydromechanics), 139-142

TOPIC TAGS: hot-wire anemometer, heat exchange, mass exchange, turbulence, turbulent flow, anemometer, non-isothermal flow

ABSTRACT: Some of the relationships in the combined processes of heat and mass exchange in a general hydrodynamic field are investigated. It was previously established that when these processes occur separately, turbulence in a flow increases the intensity of heat and mass exchange. In the present study, a hot-wire anemometer with a feedback amplifier of the type ATA-2, built by G. V. Smirnov, was used in measurements of non-isothermal flow. A short discussion is given on the precautions and corrections necessary in the use of this type of anemometer. One of the basic factors in the investigation of the influence of mass exchange on heat exchange is the influence of flow temperature on the degree of turbulence. This was investigated in an aerodynamic set-up of a closed type at zero, positive and negative pressure gradients. The results are shown in Fig. 1 of the Enclosure Card

ACCESSION NR: AT4041819

and indicate clearly that the degree of flow turbulence decreases with increasing temperature. This is explained by an increase in medium viscosity with increasing temperature, which leads to a decrease in amplitude of the turbulent pulsation of the flow. In the absence of a gradient, an increase in temperature from 20 to 130C leads to a decrease in turbulence by a factor of two. As shown in Fig. 2 of the Enclosure, an increase in the Reynolds number causes a considerable reduction in the degree of turbulence in a cold or heated flow. This is, however, an unexpected result which should be investigated further. It is concluded that the hot-wire anemometer ATA-2 can be very useful in the investigation of non-isothermal flow. Orig. art. has: 3 figures and 2 formulas.

TITLE: Heat and mass transfer in a boundary layer on a porous wall

SOURCE: AN BSSR. Institut teplo- i massoobmena. Teplo- i massoobmen tel s okruzhayushchey gazovoy sredoy (Heat and mass exchange of bodies with the surrounding gaseous medium). Minsk, Nauka i Tekhnika, 1965, 70-85

TOPIC TAGS: ^{1, 55} boundary layer theory, ^{21, 44, 55} heat transfer, ^{21, 44, 55} mass transfer, turbulent boundary layer, vaporization, surface property

ABSTRACT: The article considers the thermodynamic and hydromechanical characteristics of the process of evaporation of a drop-form liquid from a porous wall. The experimental sample (illustrated in a figure) was a glass with a diameter of 0.054 meters and a length of 0.25 meters, equipped with an ice calorimeter insulated from the rest of the internal space. The experiments were carried out in an aerodynamic tube with a sealed working section. The velocity of the

Card 1/3

L 8927-66

ACC NR: AT5027195

air flow could be varied smoothly from 2 to 18 meters/sec, and the temperature of the flow was measured from 15 to 150°C. The experimental conditions were the following: flow temperature--70, 100, 130°C; moisture content of the medium and Φ --4.1 and 0.5%, respectively; flow velocity--6, 10, 12, and 15 meters/sec. The range of Reynolds numbers, consequently, was $(2-7) \times 10^4$. The generalized relationship found for the whole range of experimental parameters for the front end of the surface of the cylinder had the form:

$$Nu_x = 1.48(e^{-2.4x} + 0.2e^{-5.4x}) \sqrt{Re_x} \lambda^{0.25} \quad (2)$$

The coefficients and the power exponents in the above formula were found by the method of least squares. The article proceeds to consider the question of developed turbulent flow in the boundary layer. The experiments on heat and mass transfer were carried out on the evaporation of water in a turbulent boundary layer from a flat ceramic fireclay plate, in a flow of heated air with a gradient. The velocity of the air flow in the working column of the aerodynamic tube was varied from 2 to 50 meters/sec. The experimental body was a single porous plate, mounted in a box divided into 8 subchambers by partitions. Measurements were made of the velocity and the temperature of the flow, the degree of its turbulence under each set of

Card 2/3

L 8927-66

ACC NR: AT5027195

temperature and velocity conditions, and the temperatures of the surface of the plate (at 16 points), the side walls of the box, the water in each chamber, and the walls of the working column. In this case, the following relationship was established:

$$Nu_p = 0.036 Re^{0.4} (1 - b_p)^{1/4}; \quad Nu_m = 0.03 Re^{0.4} (1 - b_p)^{1/4} \quad (5)$$

Orig. art. has: 6 formulas and 10 figures.

 TITLE: Effect of the turbulizing of a stream of air on heat transfer in a radiator
 SOURCE: AN BSSR. Institut teplo-1 massoobmena. Teplo-1 massoobmen tel s okruzhayushohey gazovoy sredoy (Heat and mass exchange of bodies with the surrounding gaseous medium). Minsk, Nauka i Tekhnika, 1965, 143-147
 TOPIC TAGS: ^{21,44,55} heat transfer, engine radiator, turbulent heat transfer
 ABSTRACT: Existing experimental data show that the use of a previously turbulized stream of air in various types of industrial heat exchangers can substantially increase their efficiency. Experiments were carried out on heat exchange in an oil radiator of the automobile type, with different degrees of turbulizing of the stream of air being blown through it. Hot oil from the lubricating system of a motor was circulated through a tube plate radiator. The article shows a sketch of the

Card 1/2

L 0035-00

ACC NR: AT5027200

experimental setup. At constant loads and constant revolutions of the motor and the fan, measurements were made of the temperature of the walls of the radiator tubes as well as of the temperature of oil and air at the inlet and outlet of the radiator. In addition to the temperature measurements, determinations were made of the velocity field and the degree of turbulence of the stream of air before and after the radiator. Thermodynamic calculations based on the experimental data show that the efficiency of a radiator using a "pusher" fan increased by 25% on the average. The authors conclude that the installation of "pusher" fans on transport vehicles would permit a significant reduction in the size and weight of the radiator, which would make possible a substantial saving of nonferrous metal. TITLE: On variations in the delay of radio signals in the PRV receiver

REFERENCED SOURCE: Byul. st. optich. nablyudeniya iskusstv. sputnikov Zemli, no. 40, 1964, 19-20

TOPIC TAGS: artificial earth satellite, artificial satellite observation, radio receiver, radio signal, chronograph/ PRV radio receiver

TRANSLATION: A method for determining the delay of radio signals at each passage of a satellite has been developed at the Artificial Earth Satellite Observation Station of Leningrad University. During 1962, the receiver-attachment-chronograph delay was, on the average, $+0.0119 \pm 0.0016$ sec. The average delay of the attachment-chronograph circuit was $+0.0091 \pm 0.0011$ sec. The difference, which is the actual average delay of only the PRV receiver, was $+0.0028$ sec. The delay of the entire receiver-pulse attachment -chronograph system for each artificial earth satellite observation was begun to be accounted for at the station from 1962. P. U.

TITLE: Fluctuations in radio signal delay in an RF receiver

SOURCE: Ref. zh. Radiotekhnika i elektrosvyaz', Abs. 9B358

TOPIC TAGS: artificial satellite observation, radio signal, circuit delay time, RF pulse

TRANSLATION: At an artificial earth satellite observation station attached to Leningrad University, a method of measuring the delay of radio signals on each passage of a satellite has been developed. A description of its application is given. It is shown that on the average in 1962, the delay of the receiver-adapter-chronograph circuit was 0.0119 ± 11 sec. The average delay of the adapter-chronograph circuit, however, was 0.0091 ± 11 sec. The difference, comprising the true average delay of the RF receiver alone, was approximately $+0.0028$ seconds. Since 1962, the delay of the entire system--receiver, pulse, adapter, and chronograph--has been considered at the station for each observation of an artificial earth satellite. P. U.

<p><i>ca</i></p> <p>The Ni content of hyperbasite massives of central Ural. B. M. Fedorov. <i>Tsvetnye Metally</i> 1941, No. 2-3, 6-13; <i>Khim. Referat. Zhur.</i> 4, No. 7-8, 30(1941); cf. C. A. 36, 0457. —According to the conditions of their formation the silicate Ni ores of the Ural Mountains are divided into 2 groups: the deluvial-eluvial deposits found in the Karst zones in contact with hyperbasites and limestones, and the eluvial deposits found in the weathering crust among hyperbasites. The eluvial ores are divided into the "surface" deposits forming the weathering crust and occupying a considerable area, and the "crevice" deposits found at the breaking zone. The crevice deposits are found in abundance in central Ural and extensive "surface" deposits are found in southern Ural. The hyperbasite massives form a no. of interrupted beds or merklional zones.</p> <p style="text-align: right;">W. R. Henn</p>																										<p>8</p>

<p>Relation between the arsenic and phosphorus contents of iron ores and the conditions of their formation. U. M. Fokhuy. <i>Razvedka</i> Vol. 13, No. 4, 8 14(1947).—The content of As and P in sedimentary Fe ores depends on the source of the ore-bearing solns. and on the O conditions of the medium where deposition occurred. Three such media are distinguished: oxide (rich in O), siliceous, and carbonate (poor in O). The concn. of As and P is highest in a siliceous environment of both marine and Lacustrine origin. The P content in siliceous ores varies within narrow limits, in an oxide environment there is considerably less of it and the concn. varies greatly, and there is very little of it in carbonate media. There is little As in oxide and still less in carbonate environment. Similar conditions prevail in hydrothermally formed deposits. There is less P and As in endogenic than in exogenic deposits. In contact-metamorphic deposits the P content is very spotty. In deposits formed by exsolution, the P and As content depends on the source of ore-bearing solns. as well as on the alloying and other admixts. On the Vernadskii index a value obtained by dividing the av. concn. of a given element in a deposit over its concn. in the earth's crust; values greater than 1 are referred to as concn. and are considered pos.; fractional values are referred to as depletion and are considered</p>		<p>the vol. diss. to 100 ml., and, after neutralizing to pH 5, is bubbled to ppt. the Sb as sulfide. The ppt. is washed 2 or 3 times to remove Fe, then washed into a beaker and an equal vol of concd. HCl added. After boiling to dissolve the sulfide and remove the H₂S, a little H₂O is added and the soln. is made alk. to phenolphthalein by adding a 2% soln. of NaOH, then made slightly acid with HCl and finally made alk. with NaHCO₃ soln. No other alkali must be present now, as they form interfering hypophosphates. Sb₂Cl₃ is oxidized to SbCl₅ by standard I soln. made up of 10.12 g. I to 1 l. distd. H₂O. A ml. of this soln. on 0.5 g. of ore is equal to 10% Sb. Starch is used as the indicator. In dealing with shipment concentrates the ore is dissolved in strong HCl, dissd., neutralized, and titrated directly without previous pptn. with H₂S. In the mill the ore is screened, washed, sorted, saw crushed, screened again, crushed in a Kennedy springhead crusher, and milled in "ball mills, each in closed circuit with its own classifier. Au is recovered by straking, jigging, and flotation. To recover Sb, pulp at 1:1 liquid-solid ratio is conditioned with xanthate promoter and pine oil frother for 10 min. then passed through flotation cells where the control is largely visual. For high-grade concentrate, froth should be dense and matted. For high recovery, it should be fairly loose. The final Sb concentrate is pumped to a James table for dressing, sepg. some pyrite and arsenopyrite. The concentrate then flows to 4 collecting pumps. Of the Sb in the ore, 9% is recovered as colded ore and 71% as concentrate contg. 60-65% Sb.</p>

Variations in the color index of blood as a result of malignant tumors. O. Roakin and B. Frikov. *Bull. Med. mid. exp. U. S. S. R.* 7, 6-9 (1939) (in French).--
The color index (I) of the blood of normal rats corresponds to pH 6.2-6.5, that of white mice to 5.5-5.8. The blood of rats 1-1.5 months after inoculation with Krichevskii-sarcoma and with Pleaner-Jobling carcinoma shows I corresponding to 5.6-6.3 and 5.9-6.3, resp. The I of the blood of white mice 1 month after inoculation with the Ehrlich adenocarcinoma corresponds to 5.2-5.5. In the case of malignant tumors the blood of the animals shows a marked capacity for absorbing methylene blue.
